What size are corrugated roofing sheets. Fitting plastic corrugated roofing sheets. How much should corrugated roofing sheets overlap. Corrugated roofing sheets near me. Fitting pvc corrugated roofing sheets. Fitting clear corrugated roofing sheets. Fitting corrugated metal roofing sheets. Fitting corrugated bitumen roofing sheets.

Corrugated roof fixings are simple to install which makes Corrapol Corrugated Roofing sheets an ideal roofing material for a wide range of projects and installers, even those with a little DIY experience. Understanding how to properly install corrugated roof fixings is crucial for every corrugated sheet roof as they are the most important component of the installation, after the sheets themselves. Correctly installing corrugated sheet fixings can make a big difference in the lifespan of your roof and also the durability of the roof against the weather. There are two main types of corrugated roof fixings: Corrapol-BT Flexi Cap Screws Corrapol-BT Roof Sheet Nails Both these types of Corrapol roof sheet fixings are designed for use with our corrugated bitumen roofing sheets; Corrapol®-BT and Awnapol Premium Corrugated Sheets. To suit the Awnapol and Corrapol-BT Sheets, we manufacture both the Corrapol Flex Cap Screws and Roof Sheet Nails in four colours matched to the sheets: Black, Brown, Green and Red! Corrapol-BT Corrugated Bitumen roofing sheets are one of the most cost effective roofing materials available in the market and are very easy to install making them ideal for shed roofs, lean-to roofs, and other DIY roofing projects! Awnapol® Premium Corrugated Bitumen Sheets are a heavier duty option that are more durable and robust, making them perfect for stables, garages and more! Flexi Cap Screws Vs Roof Sheet Nails - Which is the best corrugated roof fixing? The below chart shows a clear comparison of the best corrugated roof fixing to use on corrugated roofing projects, depending on your budget and project type. To summarise, Corrapol-BT Flexi Screw Cap Fixings are the best corrugated roof fixing option for any roofing project due to their stronger fixing, better longevity and superior waterproofing. This is especially the case when using Awnapol Premium Corrugated sheets as a Premium corrugated sheet deserves a premium roof sheet fixing! How Many Fixings Per Corrugated Sheet? The spacing of corrugated roof fixings is an important factor to consider when purchasing the items, you need for your roof. We suggest that a roof sheet fixing is installed every corrugation peak at the top and bottom of your roof and every second corrugation peak for intermediate purlins. Each Corrapol-BT Sheet has 10 corrugation peaks which makes it nice and easy to calculate how many fixings you will need based on your roof size and layout. All this is entirely up to the discretion of the installer as it depends on many factors including pitch, the location, the exposure of your roof etc. However, we would suggest a minimum of twenty Corrapol® -BT fixings per sheet. Generally, if you were using our superior Flexi Screw Cap fixings then there may be less required as they are a stronger fixing than the Roof Sheet Nails. The key thing to remember when deciding how many fixings you'll need is that if your roof is to last the test of time it will need to stand up to wind uplift and rain/snow loading etc (depending on location!) so it is always better to have too many rather than too little fixings

Where do Screws go on a Corrugated Roof? Always fix corrugated roof fixings through the peaks of the troughs! This is very important in maintaining the water tightness of your roof as the water tends to drain via the troughs so fixing there can cause leaks and moisture issues on your structure below. Fixing through the peaks also is a stronger position to secure the sheets because it clamps the peaks meaning the fixing force is spread down through the troughs and so covers a wider area. Here is the full guide on how to fix corrugated roof sheets: Equipment required to Install Corrugated Roof Fixings: How to Fix Corrugated Roofing Sheets - Steps: Safety First - Always wear the appropriate PPE equipment Ensure your Corrapol Eaves Fillers are in place on your purlins. These are recommended on every purlin. (Top Tip: To hold the Eaves fillers in place during installation simply pin or staple them onto your frame) If you have a string line then line up the string with each purlin one by one and mark the fixing points on your sheets. This helps keep your lines of fixings parallel! Before you start fixing the first run of sheets you should install your first Corrapol Rock N Lock Gable Flashing (or Wall Flashing if against a wall). This helps keep the sheets square across the roof and is easier done before rather than after the sheets are secured! Leave the Rock n Lock on the far end uninstalled at this point. (Please Note: Corrapol Rock N Lock fixing screws are a different type of screw so please ensure the correct screw is used) Starting at one end fix the sheets, in turn, moving across the roof. To install the roof sheets fixings either: - Use a Drill to fix the Flexi Cap Screws. Popping the caps once tightened. - Use a Rubber Mallet to fix the Roof Sheet Nails, being careful not to overdrive them When you reach the last sheet in your run of sheets ensure you have cut the sheets to size widthways to allow for the overlap and the Rock N Lock Flashing. Follow our How to Cut Corrugated Bitumen Sheet Guide for the correct method. For our full installation help and top tips please visit our Corrapol Installation Guide which goes through the full installation process in detail! Does the same method apply for fixing Corrapol Clear Plastic Roofing sheets? Corrugated Plastic Roof Sheet fixings are similar to Corrapol-BT Flexi Cap Screw fixings, however, vary on the method and installation set up so please refer to our Corrapol Installation Guide for full details. Did you know that Corrapol Stormproof, Corrapol PVC and Corrapol GRP Sheets can be co-installed with our corrugated bitumen ranges? A great way to create a DIY rooflight! Is there other roof sheet fixing alternatives that I can use? There are a wide range of fixing types on the market, however, be aware that not all are suitable are corrugated sheets so best to stay with those designed specifically for use with corrugated bitumen sheets, like our Flexi Cap Screws. To fix roofing sheets to steel and metal frames sometimes a Hook Bolt or J Bolt can be used to fit the material to the beams below by hooking over the edge of the beams. Can you walk on corrugated bitumen sheets? When people ask 'Can you walk on a bitumen roof' we are often worried about the risk to an installer attempting this so tend to strongly advise against it for safety reasons. If you follow the method above and fix each sheet in order then it shouldn't be necessary to go back on the roof. However, if you do require to go onto the roof anytime just ensure you use a crawling board. Have a question about installing corrugated roofing sheets or fixings? Feel free to leave a comment question below and we'll respond publicly to help any other DIYers with the same question! Alternatively, chat with our product experts on our Live Chat with any unanswered questions you have! No products in the cart. Corrugated roofing is a great way to top a garden shed or patio. It's low cost and relatively straightforward to install. Once it's in place you will have a durable shed roof which will withstand all weathers. This guide concentrates on installing corrugated bitumen sheeting onto the apex roof of a new build project. To replace existing roofing, survey your roof structure and decide whether it will need strengthening or maintenance before you replace the roofing sheets. Make a note of the roof construction. To install the sheeting you will require: A purlin on rafters (a purlin is a horizontal bar or beam which directly supports the roof structure. Most roofs are supported by purlins) A decked roof, e.g. roofing grade OSB or plywood supported on a traditional trussed roof structure Take care to fix the bitumen corrugated sheets the correct way up. The top of the sheet has a smooth grain surface, and the underside of the sheet has a dimpled rough surface. The sheets also finish with the corrugation edge facing down to the surface of the roof. Measuring the roof slopes The angle and slope of your roof will determine the level of support needed for the corrugated sheeting. Calculate the slope of your roof by measuring its angle with a protractor. Then select one of the three options below. Each option details the following: The minimum support required below the sheets How to lay the sheets with the correct overlap between them at the ends and the sides The sheet fixings required Nail every corrugation along the eaves, either side of the vertical laps and every other corrugation onto the purlins in an offset pattern. Fix the sheets onto the purlins at maximum centres of 61cm. Corrugation end lap: 17cm. Corrugation side lap: one ridge. Nails per sheet: 20. Fix the sheets onto the purlins at maximum centres of 45cm. Corrugation end lap: 20cm. Corrugation side lap: one ridge. Nails per sheet: 25. The sheets must be laid on a fully supporting roof deck. Corrugation end lap: 30cm. Corrugation side lap: two ridges. Nails per sheet: 20. Preparing the shed roof Plan out how many corrugated sheets you will need, and where they will be fixed. Start by laying alternate courses of sheets using a half sheet width. This forms a broken bond sheet pattern, which should help you avoid assembling a 4-ply sheet thickness at the corners of the sheets. Position and fix additional purlin beam at the ridge, where the two roof slopes meet. Check that the roof boards are at least 20mm thick so they will accept nails. If the wood is thinner than 20mm you can either apply battens or boarding for extra thickness, or alternatively you can substitute screws for nails. Cutting the corrugated sheets to size Measure the size of sheets required and mark out the line to be cut with chalk or pencil. Support the sheet so it's secure and use a coarse-bladed saw to make the cut. It helps to use a bit of oil to lubricate the blade beforehand. Alternatively you can use a circular power saw to make the cut. Some bitumen sheeting can also be cut with a sharp retractable knife. Mark out the cut line along the base of a ridge, then cut or score with the knife. Then fold back the sheet along the scored line to separate the sections. Fitting the corrugated roof sheets The sheets should overhang the fascia by about 5cm to form a drip edge. Reduce the fixing centre to the first purlin up from the eaves by 5cm to compensate for the overhang. Ensure that the first sheet is positioned square to the line of the eaves and the edge. Nail the edges down first. When you nail the sheet down, make sure that the washer is in the right position, so you can clip the cap down after fixing. Alternatively use a 65mm exterior screw to fix the sheet to the purlin. You can use a 55mm screw if your decking is thinner. Repeat this process until all the corrugated sheets have been secured to the roof. How to seal a corrugated roof Position and fix the edge barge board appropriately, then fold down over the roof sheet and nail to the purlin using 10mm galvanised clout nails at 15cm intervals. Alternatively you can fix the edge barge board so that it overlaps the edge by 5mm, and secure the sheet by nailing it to the purlins. Overlay your ridge piece over the roof apex and mark out the fixing line. Carefully bend the ridge piece so it sits as required on both of the roof slopes. Each ridge piece should feature pre-formed end alignment grooves embossed into the material. Simply overlap and align these grooves to ensure a professional finish. The ridge pieces should be flexible enough to fit the form of the roof. Fix one side first by nailing to the corrugated roofing, then fix the other side. You can also cap each end of the ridge with a treated timber finial which has been cut to match the ridge piece profile. Fix the finial to the roof edge boards and then fix the ridge board to the finial.
